

Initialization

Initialize hashmap

target = 9

nums

7	13	11	2	8
0	1	2	3	4

numberIndexMap

Iteration 1

Calculate number needed to reach target

numberNeeded = 2 is not present in hashmap.

So, add the current number along with its index to hashmap and continue to next iteration

$$\text{numberNeeded} = \text{target} - \text{current number} = 9 - 7 = 2$$

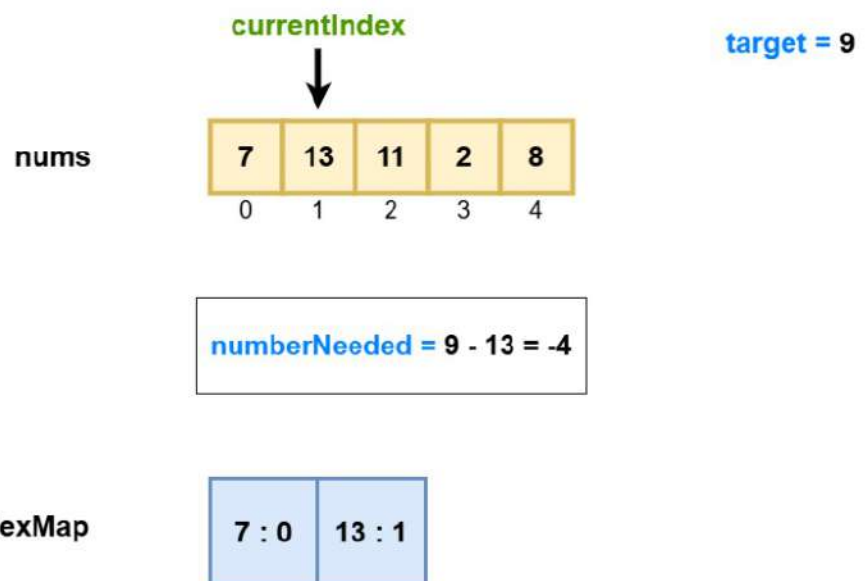

numberIndexMap

7 : 0

Iteration 2

numberNeeded = -4 is not present in hashmap.

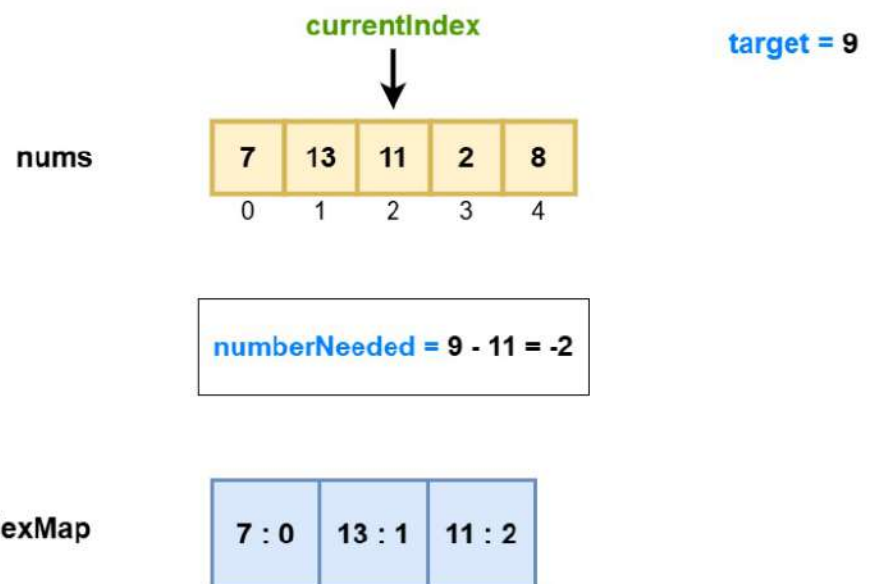

So, add the current number along with its index to hashmap and continue to next iteration

Iteration 3

numberNeeded = -2 is not present in hashmap.

So, add the current number along with its index to hashmap and continue to next iteration

Iteration 4

numberNeeded = 7 is present in
hashmap.

Therefore return indices of current
number and numberNeeded as
result
